Meet me service

Main purpose of this service is to simplify contacting and meeting your friends, those one you see every day and those you haven't seen for ages. Each day you travel through the city, where each day your friends do the same. How often you pass each other without knowing that? what if this is your "long-time-not-seen" friend from childhood? How good would be to "catch up" with him and drink a cup of tea or a glass of beer? Pretty good! With our app user will have possibility(one of many) to track nearest area (for example with different radius) looking for friends from his contact book. Then, easily set up a meeting and contact with them. This main functionality would work independently on synchronized social service or application platform. Just one click and other will have notifications whatever they are using(Facebook, Google+). Going further, this app may be target to the party cowboys who are new in the town, people who try to integrate with new people, bored tourist looking for quick open events, lost friends who are on the wrong street close to the meeting group, impatient persons who want to track latecomers. This is just a base. Below we pointed possible main functionalities of this application:

Functionality:
  ● Create events (meetings)
It is possible create events that other people might join. A person can be added to the event according to the contact method available. For instance, it is possible to add a person to the event by its email, phone number or by membership to service. Also collecting contacts from popular social sites will be available (at least facebook).
  ● Invite contacts to events (method yet to decide)
To invite a person to a meeting there are going to be several different options. If the invited contact has given its email address, it will get a notification by email and an invite to be integrated on Outlook/Google Calendar. In case of having only its phone number, the person should get

an SMS. If person has account in service, event is be shown on board (to decide, way of selecting messages/event/meetings).

- Track contacts location (requesting permission?)

If there's a meeting with a location set and one or many of the members are in the meeting place, one or many may help someone else who hasn't joined the meeting, find the place. For instance, a person can't find the meeting place, so it sends a request to find the rest of the members and in case of they are already in such meeting place, he or she will get their position and a map to get the place. Besides this option, it is possible to know the location of the rest of the members who haven't arrived to calculate how long they'll take to arrive.

- System to choose the event date (similar to doodle), as suggested by Mr. Walkowiak
- Check location of the event
- Web application with mobile version
- Mobile application:
    - Android application
    - IOS application (depends on group capabilities)
- Chat with invited people around one event.
- Posting messages on event "wall"
- Different modes of confirmation in invitation: must confirm, not necessary, no confirmation.
- Each user has status (in work, available, not available, busy, etc.)
- It is possible to set visibility of the event (visible to all, to selected group, to selected people)
- User profile will be very simple, allowing to keep some personal data (name, surname, address, image (avatar), email)
